## 1 Introduction

Pre-calculus consists of algebra and trigonometry. My favorite equation from algebra is

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}, \tag{1}$$

and my favorite equation from trigonometry is

$$x^2 + y^2 = 1,$$

which doesn't look like much until you remember that

$$\begin{aligned} x &= \cos(\theta) \\ y &= \sin(\theta). \end{aligned} \tag{2}$$

Note that the previous sentence extended over several displayed equations, with proper punctuation in each. (You should always type something after an equation, otherwise there is too much white space before whatever comes next.)

## 2 Exponentials and logarithms

These are some of the most important functions in all of mathematics. See [1, Chapter 4]. Unfortunately, many people do not like them very much.

### 2.1 Logarithms

I learned in Calculus II that the natural logarithm can be defined in terms of an integral:

$$\ln(x) = \int_1^x \frac{1}{t} dt, \quad x > 0. \quad (3)$$

(See [2] for more information.) Note that it is important to state the domain of definition. Also, I always like to put parentheses around the arguments of functions like natural logarithm, sine, and cosine, cf. Equation 2.

**Theorem 1.** *The function  $\ln$  is strictly increasing and continuous. Its range is  $(-\infty, \infty)$ .*

*Proof.* We omit the proof for brevity. □

**Remark 2.** *One often makes remarks after theorems. In this article, remarks are numbered separately from equations.*

### 2.2 Exponentials

Once you show that the function  $\ln$  is strictly increasing, continuous, and has range  $(-\infty, \infty)$ , you can define the exponential function as its inverse.

## 8 Polynomials

Section 2 discussed exponentials and logarithms. Now we turn to something easier: polynomials. The zeros of quadratic polynomials can be found using Equation 1 on page 1.

## A Appendix

This  $\LaTeX$ document contains several types of cross-references, references to equations, to pages, and to cited works. Each equation or cited work that will be cited needs to be assigned an alphanumeric tag, but  $\LaTeX$  automatically numbers equations, pages, and citations. That way, if you add more later, you need not fix all the cross-references. Note that  $\LaTeX$  needs to be run more than once to get all the references straight.
